## Aryl Substituted Pyrazoles, Imidazoles, Oxazoles, Thiazoles and Pyrroles, and the Use Thereof

5

### *Background of the Invention*

#### 10 *Field of the Invention*

This invention is in the field of medicinal chemistry. In particular, the invention relates to aryl substituted pyrazoles, imidazoles, oxazoles, thiazoles and pyrroles, and the discovery that these compounds are anticonvulsants and act as  
15 blockers of sodium ( $\text{Na}^+$ ) channels.

#### *Related Background Art*

Several classes of therapeutically useful drugs, including local anesthetics such  
20 as lidocaine and bupivacaine, antiarrhythmics such as propafenone and amioclarone, and anticonvulsants such as lamotrigine, phenytoin and carbamazepine, have been shown to share a common mechanism of action by blocking or modulating  $\text{Na}^+$  channel activity (Catterall, W.A., *Trends Pharmacol. Sci.* 8:57-65 (1987)). Each of these agents is believed to act by interfering with the rapid influx of  $\text{Na}^+$  ions.

25 Recently, other  $\text{Na}^+$  channel blockers such as BW619C89 and lifarizine have been shown to be neuroprotective in animal models of global and focal ischemia and are presently in clinical trials (Graham *et al.*, *J. Pharmacol. Exp. Ther.* 269:854-859 (1994); Brown *et al.*, *British J. Pharmacol.* 115:1425-1432 (1995)).

The neuroprotective activity of  $\text{Na}^+$  channel blockers is due to their  
30 effectiveness in decreasing extracellular glutamate concentration during ischemia by inhibiting the release of this excitotoxic amino acid neurotransmitter. Studies have

shown that unlike glutamate receptor antagonists, Na<sup>+</sup> channel blockers prevent hypoxic damage to mammalian white matter (Stys *et al.*, *J. Neurosci.* 12:430-439 (1992)). Thus, they may offer advantages for treating certain types of strokes or neuronal trauma where damage to white matter tracts is prominent.

Another example of clinical use of a Na<sup>+</sup> channel blocker is riluzole. This drug has been shown to prolong survival in a subset of patients with ALS (Bensim *et al.*, *New Engl. J. Med.* 330:585-591 (1994)) and has subsequently been approved by the FDA for the treatment of ALS. In addition to the above-mentioned clinical uses, carbamazepine, lidocaine and phenytoin are occasionally used to treat neuropathic pain, such as from trigeminal neurologia, diabetic neuropathy and other forms of nerve damage (Taylor and Meldrum, *Trends Pharmacol. Sci.* 16:309-316 (1995)), and carbamazepine and lamotrigine have been used for the treatment of manic depression (Denicott *et al.*, *J. Clin. Psychiatry* 55: 70-76 (1994)). Furthermore, based on a number of similarities between chronic pain and tinnitus (Moller, A. R. *Am. J. Otol.* 18: 577-585 (1997); Tonndorf, *J. Hear. Res.* 28: 271-275 (1987)) it has been proposed that tinnitus should be viewed as a form of chronic pain sensation (Simpson, J. J. and Davies, E. W. *Tip.* 20: 12-18 (1999)). Indeed, lignocaine and carbamazepine have been shown to be efficacious in treating tinnitus (Majumdar, B. *et al. Clin. Otolaryngol.* 8: 175-180 (1983); Donaldson, I. *Laryngol. Otol.* 95: 947-951 (1981)).

It has been established that there are at least five to six sites on the voltage-sensitive Na<sup>+</sup> channels which bind neurotoxins specifically (Catterall, W.A., *Science* 242:50-61 (1988)). Studies have further revealed that therapeutic antiarrhythmics, anticonvulsants and local anesthetics whose actions are mediated by Na<sup>+</sup> channels, exert their action by interacting with the intracellular side of the Na<sup>+</sup> channel and allosterically inhibiting interaction with neurotoxin receptor site 2 (Catterall, W.A., *Ann. Rev. Pharmacol. Toxicol.* 10:15-43 (1980)).

Unlike the semicarbazones disclosed by Dimmock *et al.* in U.S. Patent No. 5,741,818, which are somewhat flexible molecules, the pyrazoles, imidazoles, oxazoles, thiazoles and pyrroles are much more rigid. In addition, the electronics of the pyrazole, imidazole, oxazole, thiazole and pyrrole ring are very different from that of a semicarbazone. For example, the 2'-nitrogen present in the semicarbazone is now replaced with the nitrogen atom at the 2-position of the pyrazole and thus is part of the six electron aromatic ring. Unlike the aminoalkanamides described by Pevarello, which contain a basic amine ( $pK_a > 7$ ), the heteroaryl compounds of the invention do not have to be basic. Pyrazole, for example, is half-protonated only at pH 2.5 and substitution with an electron withdrawing carbonyl is expected to reduce its basicity further. In addition, it was found that the primary amides present in the semicarbazones and the aminopropionamides are not necessary for activity as sodium channel blockers in the aryl-pyrazoles and -imidazoles claimed in the present application. Based on these considerations, it is an unexpected finding that the aryl substituted pyrazoles, imidazoles, oxazoles, thiazoles and pyrroles show good activity as sodium channel blockers.

Since the compounds of Formula *I* are blockers of sodium ( $Na^+$ ) channels, a number of diseases and conditions mediated by sodium ion influx can be treated employing these compounds. Therefore, the invention is related to a method of treating, preventing or ameliorating neuronal loss associated with stroke, global and focal ischemia, CNS trauma, hypoglycemia and surgery, spinal cord trauma; as well as treating or ameliorating neurodegenerative diseases including Alzheimer's disease, amyotrophic lateral sclerosis, Parkinson's disease, treating or ameliorating anxiety, convulsions, glaucoma, migraine headache, and muscle spasm. The compounds of Formula *I* are also useful as antitinnitus agents, antimanic depressants, as local anesthetics, and as antiarrhythmics; as well as for treating, preventing or ameliorating pain including surgical, chronic and neuropathic pain. In each instance, the methods of the present invention require administering to an animal in need of such treatment an effective amount of a sodium channel blocker of the present invention, or a pharmaceutically acceptable salt or prodrug thereof.

As used herein, the term "stereoisomers" is a general term for all isomers of individual molecules that differ only in the orientation of their atoms in space. It includes enantiomers and isomers of compounds with more than one chiral center that are not mirror images of one another (diastereomers).

The term "chiral center" refers to a carbon atom to which four different groups are attached.

The term "enantiomer" or "enantiomeric" refers to a molecule that is nonsuperimposable on its mirror image and hence optically active wherein the enantiomer rotates the plane of polarized light in one direction and its mirror image rotates the plane of polarized light in the opposite direction.

The term "racemic" refers to a mixture of equal parts of enantiomers and which is optically inactive.

The term "resolution" refers to the separation or concentration or depletion of one of the two enantiomeric forms of a molecule.

The invention is also directed to a method for treating disorders responsive to the blockade of sodium channels in animals suffering thereof. Particular preferred embodiments of the aryl substituted heteroaryl compounds for use in method of this invention are represented by previously defined Formulae *I-IV*.

- 10 The invention is also directed to  $^3\text{H}$  and  $^{14}\text{C}$  radiolabeled compounds of Formula *I* and their use as radioligands for their binding site on the sodium channel. For example, one use of the labeled compounds of the invention is the characterization of specific receptor binding. Another use of the labeled compounds of

5           Tritiated compounds of Formula *I* can be prepared by introducing tritium into the compound of Formula *I* by, for example, catalytic dehalogenation with tritium. This method includes reacting a suitably halogen-substituted precursor of a compound of Formula *I* with tritium gas in the presence of a suitable catalyst, for example Pd/C, in the presence or absence of a base. Other suitable methods for preparing tritiated  
10           compounds can be found in Filer, *Isotopes in the Physical and Biomedical Sciences, Vol. 1, Labeled Compounds (Part A)*, Chapter 6. <sup>14</sup>C-labeled compounds can be prepared by employing starting materials having a <sup>14</sup>C carbon.

          The compounds of the present invention were assessed by electrophysiological assays in dissociated hippocampal neurons for sodium channel blocker activity.  
15           These compounds also could be assayed for binding to the neuronal voltage-dependent sodium channel using rat forebrain membranes and [<sup>3</sup>H]BTX-B.

          Sodium channels are large transmembrane proteins that are expressed in various tissues. They are voltage sensitive channels and are responsible for the rapid increase of Na<sup>+</sup> permeability in response to depolarization associated with the action  
20           potential in many excitable cells including muscle, nerve and cardiac cells.

          One aspect of the present invention is the discovery of the mechanism of action of the compounds herein described as specific Na<sup>+</sup> channel blockers. Based upon the discovery of this mechanism, these compounds are contemplated to be useful in treating or preventing neuronal loss due to focal or global ischemia, and in treating  
25           or preventing neurodegenerative disorders including ALS, anxiety, and epilepsy. They are also expected to be effective in treating, preventing or ameliorating neuropathic pain, surgical pain, chronic pain and tinnitus. The compounds are also expected to be useful as antiarrhythmics, anesthetics and antimanic depressants.

          The present invention is directed to compounds of Formulae *I-IV* that are  
30           blockers of voltage-sensitive sodium channels. According to the present invention, those compounds having preferred sodium channel blocking properties exhibit an IC<sub>50</sub>

of about 100  $\mu\text{M}$  or less in the electrophysiological assay described herein. Preferably, the compounds of the present invention exhibit an  $\text{IC}_{50}$  of 10  $\mu\text{M}$  or less. Most preferably, the compounds of the present invention exhibit an  $\text{IC}_{50}$  of about 1.0  $\mu\text{M}$  or less. Substituted heteroaryl compounds of the present invention may be tested  
5 for their  $\text{Na}^+$  channel blocking activity by the following electrophysiological and binding assays.

*Electrophysiological Assay 1:*

10 *Cell preparation:* HEK-293 cells stably expressing the hSkM1 isoform of  $\text{Na}^+$  channels (generous gift from Dr. A. L. George, Vanderbilt University Medical School) were cultured using standard techniques, as described previously (Verdoorn, T.A., *et al.*, *Neuron* 4:919-928 (1990)). For electrophysiology, cells were plated onto  
15 35 mm Petri dishes (pre-coated with poly-D-lysine) at a density of 1:40 on the day of re-seeding from confluent cultures. Our experience has been that cells are suitable for recordings for 2-3 days after plating.

*Patch-clamp recordings of voltage-sensitive  $\text{Na}^+$  currents:* Whole-cell voltage-clamp recordings were made using conventional patch-clamp techniques (Hamill *et al.*, *Pfluegers Arch.* 391:85-100 (1981)) with an Axopatch 200A amplifier  
20 (Axon Instruments, Foster City, CA). Recordings were made within 2-3 hours after neuron dissociation. The recording chamber was continuously superfused with the external solution (150 mM NaCl, 5.4 mM KCl, 1.8 mM  $\text{CaCl}_2$ , 1 mM  $\text{MgCl}_2$ , 10 mM HEPES, 10 mM glucose, pH 7.4 (NaOH)) at a speed of about 1 mL/min. Recording  
25 pipettes were pulled from thick-walled capillaries (WPI, Sarasota, FL) and fire-polished. The pipette resistances ranged from 1 to 3  $\text{M}\Omega$  when the pipettes were filled with internal solution containing (in mM): 110 CsF, 10 NaCl, 5  $\text{MgCl}_2$ , 11 EGTA, 10 HEPES, pH adjusted to 7.4 with CsOH. Osmolality was set with a difference of 15-  
30 20 mmol/kg between external and internal solutions (lower inside the cell). Drugs and intervening wash-outs were applied through a linear array of flow pipes (Drummond Microcaps, 2  $\mu\text{L}$ , 64-mm length). Compounds are dissolved in dimethylsulfoxide (DMSO) to make a 30 mM stock solution, which was subsequently

diluted into the external solution to give final concentrations of 0.1-100  $\mu$ M. At the highest (1%) concentration, DMSO inhibited the size of  $\text{Na}^+$  current only slightly. Currents were recorded at room temperature (22-25°C), filtered at 5 kHz with an active 8-pole Bessel filter (Frequency Devices, Haverhill, MA), digitized at 10-50  $\mu$ s intervals, and stored using Digidata 1200 analog/digital interface with Pclamp6/Clampex software (Axon Instruments). Series resistance was cancelled typically by ~75% when necessary. The inhibitory potency of drugs was assessed by measuring reductions in the peak amplitude of  $\text{Na}^+$  currents induced by increasing concentrations of compounds tested.  $\text{Na}^+$  currents were elicited by stepping membrane voltage from holding potentials over the range -100 mV to -50 mV, to a pulse potential of -10 mV. The test pulse duration was 5-10 msec, repeated at a frequency  $\leq$  1 Hz. Concentration-inhibition curves were fitted with equation 1:

$$I/I_{\text{control}} = 1/(1 + ([\text{compound}]/IC_{50})) \quad \text{Eq. 1}$$

where  $I_{\text{control}}$  is the maximal  $\text{Na}^+$  current in the absence of antagonist, [compound] is the drug concentration, and  $IC_{50}$  is the concentration of compound that produces half maximal inhibition.

## *Electrophysiological Assay 2:*

*Cell preparation:* HEK-293 (NaIIA-B2) cell line stably expressing the rBIIA isoform of  $\text{Na}^+$  channels was established in-house. The cells were cultured using standard techniques, as described previously (Verdoorn, T.A, *et al.*, *Neuron* 4:919-928 (1990)). For electrophysiology, cells were plated onto poly-D-lysine pre-coated Cellware 35 mm Petri dishes (BIOCOAT, Becton Dickinson) at a density of  $\sim 10^4$  cells/dish on the day of re-seeding from confluent cultures. Our experience has been that cells are suitable for recordings for 2-3 days after plating.

*Patch-clamp recordings of voltage-sensitive  $\text{Na}^+$  currents:* Whole-cell voltage-clamp recordings were made using conventional patch-clamp techniques (Hamill *et al.*, *Pfluegers Arch.* 391:85-100 (1981)) with an Axopatch 200A amplifier

(Axon Instruments, Foster City, CA). The recording chamber was continuously superfused with the external solution (150 mM NaCl, 5.4 mM KCl, 1.8 mM  $\text{CaCl}_2$ , 1 mM  $\text{MgCl}_2$ , 10 mM HEPES, 10 mM glucose, pH 7.4 adjusted with NaOH, osmolality ~320 mmol/kg) at a speed of about 1 mL/min. Recording pipettes were pulled from the thick-walled capillaries (WPI, Sarasota, FL) and fire-polished. The pipette resistances ranged from 1 to 3 M $\Omega$  when the pipettes were filled with internal solution containing (in mM): 130 CsF, 20 NaCl, 2  $\text{MgCl}_2$ , 10 EGTA, 10 HEPES, pH adjusted to 7.4 with CsOH, osmolality ~310 mmol/kg. Drugs and intervening wash-outs were applied through a linear array of flow pipes (Drummond Microcaps, 2  $\mu\text{L}$ , 64-mm length). Compounds are dissolved in dimethylsulfoxide (DMSO) to make a 30 mM stock solution, which was subsequently diluted into the external solution to give final concentrations of 0.1-100  $\mu\text{M}$ . At the highest (1 %) concentration, DMSO inhibited the size of  $\text{Na}^+$  current only slightly. Currents were recorded at room temperature (22-25  $^{\circ}\text{C}$ ), filtered at 3 kHz with an active 8-pole Bessel filter (Frequency Devices, Haverhill, MA), digitized at 10-50  $\mu\text{s}$  intervals, and stored using Digidata 1200 analog/digital interface with Pclamp6/Clampex software (Axon Instruments). Series resistance was cancelled typically by ~75% when necessary.

The following voltage pulse protocols were used to assess the potency and kinetics of inhibition of the  $\text{Na}^+$  channels by the compounds (Fig. 1).

**Figure 1.** Voltage pulse protocols. **A.** IV-curves. **C.** Steady-state inactivation. **B.** Repriming kinetics. **D.** Time course of binding.

5

10

15

20

Current-voltage relationship (IV-curve), protocol **A**, was used to report the voltage at which the maximal inward  $\text{Na}^+$  current is achieved. This voltage was used throughout the experiment as testing voltage,  $V_t$ . The steady-state inactivation (or, availability) curve, protocol **C**, was used to get the voltage at which almost complete ( $\geq 95\%$ ) inactivation of  $\text{Na}^+$  channels occurs; it served as voltage for conditioning prepulse,  $V_c$ , throughout the experiment. Protocol **B** reports how fast the channels recover from inactivation at hyperpolarized voltages. This permitted us to set up the duration of the hyperpolarization gap which is used in measurement of the kinetics of binding of compounds to inactivated  $\text{Na}^+$  channels (protocol **D**). Channel repriming under control conditions was fast ( $\geq 90\%$  recovery during first 5-10 ms). If a drug substantially retards the repriming process then it becomes possible (protocol **D**) to accurately measure the kinetics of binding of the inhibitor to inactivated channels as well as the steady-state affinity ( $k_+$  and  $K_i$ ). To estimate  $k_+$  values the reduction in peak currents in successive trials with varying pre-pulse duration was plotted as a function of pre-pulse duration and the time constant ( $\tau$ ) measured by mono-exponential fit. A plot of  $1/\tau$  as a function of antagonist concentration then allowed calculating of the macroscopic binding rates of the antagonists. To determine  $K_i$  values the partial inhibition curves measured by fractional responses in steady-state were fitted with the logistic equation:

$$I/I_{\text{control}} = 1/(1 + ([\text{antagonist}]/K_i)^p), \quad \text{Eq. 2}$$

where  $I_{\text{control}}$  is the maximal  $\text{Na}^+$  current in the absence of antagonist,  $[\text{antagonist}]$  is the drug concentration,  $K_i$  is the concentration of antagonist that produces half maximal inhibition, and  $p$  is the slope factor.

### ***In vitro Binding Assay:***

The ability of compounds of the present invention to modulate either site 1 or site 2 of the  $\text{Na}^+$  channel was determined following the procedures fully described in Yasushi, *J. Biol. Chem.* 261:6149-6152 (1986) and Creveling, *Mol. Pharmacol.* 23:350-358 (1983), respectively. Rat forebrain membranes were used as sources of  $\text{Na}^+$  channel proteins. The binding assays were conducted in 130  $\mu\text{M}$  choline chloride at 37°C for 60-minute incubation with [ $^3\text{H}$ ] saxitoxin and [ $^3\text{H}$ ] batrachotoxin as radioligands for site 1 and site 2, respectively.

### ***In vivo Pharmacology:***

The compounds of the present invention may be tested for *in vivo* anticonvulsant activity after i.v., p.o. or i.p. injection using a number of anticonvulsant tests in mice, including the maximum electroshock seizure test (MES). Maximum electroshock seizures were induced in male NSA mice weighing between 15-20 g and male Sprague-Dawley rats weighing between 200-225 g by application of current (50 mA, 60 pulses/sec, 0.8 msec pulse width, 1 sec duration, D.C., mice; 99 mA, 125 pulses/sec, 0.8 msec pulse width, 2 sec duration, D.C., rats) using a Ugo Basile ECT device (Model 7801). Mice were restrained by gripping the loose skin on their dorsal surface and saline-coated corneal electrodes were held lightly against the two corneae. Rats were allowed free movement on the bench top and ear-clip electrodes were used. Current was applied and animals were observed for a period of up to 30 seconds for the occurrence of a tonic hindlimb extensor response. A tonic seizure was defined as a hindlimb extension in excess of 90 degrees from the plane of the body. Results were treated in a quantal manner.

The compounds may be tested for their antinociceptive activity in the formalin model as described in Hunskaar, S., O. B. Fasmer, and K. Hole. *J. Neurosci. Methods* 14: 69-76 (1985). Male Swiss Webster NIH mice (20-30 g; Harlan, San Diego, CA) were used in all experiments. Food was withdrawn on the day of experiment. Mice were placed in Plexiglass jars for at least 1 hour to accommodate to the environment. Following the accommodation period mice were weighed and given either the compound of interest administered i.p. or p.o., or the appropriate volume of vehicle (10 % Tween-80). Fifteen minutes after the i.p. dosing, and 30 minutes after the p.o. dosing mice were injected with formalin (20  $\mu$ L of 5% formaldehyde solution in saline) into the dorsal surface of the right hind paw. Mice were transferred to the Plexiglass jars and monitored for the amount of time spent licking or biting the injected paw. Periods of licking and biting were recorded in 5 minute intervals for 1 hour after the formalin injection. All experiments were done in a blinded manner during the light cycle. The early phase of the formalin response was measured as licking / biting between 0-5 min, and the late phase was measured from 15-50 min. Differences between vehicle and drug treated groups were analyzed by one-way analysis of variance (ANOVA). A P value  $\leq 0.05$  was considered significant. Having activity in blocking the acute and second phase of formalin-induced paw-licking activity, the compounds are considered to be efficacious for acute and chronic pain.

The compounds may be tested for their potential for the treatment of chronic pain (antiallodynic and antihyperalgesic activities) in the Chung model of peripheral neuropathy. Male Sprague-Dawley rats weighing between 200-225 g were anesthetized with halothane (1-3 % in a mixture of 70 % air and 30 % oxygen) and their body temperature controlled during anesthesia through use of a homeothermic blanket. A 2-cm dorsal midline incision was then made at the L5 and L6 level and the para-vertebral muscle groups retracted bilaterally. L5 and L6 spinal nerves were then be exposed, isolated, and tightly ligated with 6-0 silk suture. A sham operation was performed exposing the contralateral L5 and L6 spinal nerves as a negative control.

*Tactile Allodynia:* Rats were transferred to an elevated testing cage with a wire mesh floor and allowed to acclimate for five to ten minutes. A series of Semmes-Weinstein monofilaments were applied to the plantar surface of the hindpaw to

determine the animal's withdrawal threshold. The first filament used possessed a buckling weight of 9.1 gms (.96 log value) and was applied up to five times to see if it elicited a withdrawal response. If the animal had a withdrawal response then the next lightest filament in the series would be applied up to five times to determine if it could  
5 elicit a response. This procedure was repeated with subsequent lesser filaments until there was no response and the lightest filament that elicited a response was recorded. If the animal did not have a withdrawal response from the initial 9.1 gms filament then subsequent filaments of increased weight were applied until a filament elicited a response and this filament was then recorded. For each animal, three measurements  
10 were made at every time point to produce an average withdrawal threshold determination. Tests were performed prior to and at 1, 2, 4 and 24 hours post drug administration. Tactile allodynia and mechanical hyperalgesia tests were conducted concurrently.

*Mechanical Hyperalgesia:* Rats were transferred to an elevated testing cage  
15 with a wire mesh floor and allowed to acclimate for five to ten minutes. A slightly blunted needle was touched to the plantar surface of the hindpaw causing a dimpling of the skin without penetrating the skin. Administration of the needle to control paws typically produced a quick flinching reaction, too short to be timed with a stopwatch and arbitrarily given a withdrawal time of 0.5 sec. The operated side paw of  
20 neuropathic animals exhibited an exaggerated withdrawal response to the blunted needle. A maximum withdrawal time of ten seconds was used as a cutoff time. Withdrawal times for both paws of the animals were measured three times at each time point with a five-minute recovery period between applications. The three measures were used to generate an average withdrawal time for each time point.  
25 Tactile allodynia and mechanical hyperalgesia tests were conducted concurrently.

J. Pharmacol.* 236:347-353 (1993)) and Graham *et al.* (*J. Pharmacol. Exp. Therap.*

5 Compositions within the scope of this invention include all compositions wherein the compounds of the present invention are contained in an amount that is effective to achieve its intended purpose. While individual needs vary, determination of optimal ranges of effective amounts of each component is within the skill of the art. Typically, the compounds may be administered to mammals, e.g. humans, orally at a dose of 0.0025 to 50 mg/kg, or an equivalent amount of the pharmaceutically acceptable salt thereof, per day of the body weight of the mammal being treated for  
10 epilepsy, neurodegenerative diseases, anesthetic, arrhythmia, manic depression, and pain. For intramuscular injection, the dose is generally about one-half of the oral dose.

In the method of treatment or prevention of neuronal loss in global and focal  
15 ischemia, brain and spinal cord trauma, hypoxia, hypoglycemia, status epilepsy and surgery, the compound can be administered by intravenous injection at a dose of about 0.025 to about 10 mg/kg.

The unit oral dose may comprise from about 0.01 to about 50 mg, preferably about 0.1 to about 10 mg of the compound. The unit dose may be administered one or  
20 more times daily as one or more tablets each containing from about 0.1 to about 10, conveniently about 0.25 to 50 mg of the compound or its solvates.

In addition to administering the compound as a raw chemical, the compounds of the invention may be administered as part of a pharmaceutical preparation containing suitable pharmaceutically acceptable carriers comprising excipients and  
25 auxiliaries which facilitate processing of the compounds into preparations which can be used pharmaceutically. Preferably, the preparations, particularly those preparations which can be administered orally and which can be used for the preferred type of administration, such as tablets, dragees, and capsules, and also preparations which can be administered rectally, such as suppositories, as well as suitable solutions for  
30 administration by injection or orally, contain from about 0.01 to 99 percent, preferably from about 0.25 to 75 percent of active compound(s), together with the excipient.

Also included within the scope of the present invention are the non-toxic pharmaceutically acceptable salts of the compounds of the present invention. Acid addition salts are formed by mixing a solution of the particular heteroaryl compound of the present invention with a solution of a pharmaceutically acceptable non-toxic acid such as hydrochloric acid, fumaric acid, maleic acid, succinic acid, acetic acid, citric acid, tartaric acid, carbonic acid, phosphoric acid, oxalic acid, dichloroacetic acid, and the like. Basic salts are formed by mixing a solution of the heteroaryl compound of the present invention with a solution of a pharmaceutically acceptable non-toxic base such as sodium hydroxide, potassium hydroxide, choline hydroxide, sodium carbonate and the like.

The pharmaceutical compositions of the invention may be administered to any animal that may experience the beneficial effects of the compounds of the invention. Foremost among such animals are mammals, e.g., humans, although the invention is not intended to be so limited.

The pharmaceutical compositions of the present invention may be administered by any means that achieve their intended purpose. For example, administration may be by parenteral, subcutaneous, intravenous, intramuscular, intraperitoneal, transdermal, or buccal routes. Alternatively, or concurrently, administration may be by the oral route. The dosage administered will be dependent upon the age, health, and weight of the recipient, kind of concurrent treatment, if any, frequency of treatment, and the nature of the effect desired.

The pharmaceutical preparations of the present invention are manufactured in a manner which is itself known, for example, by means of conventional mixing, granulating, dragee-making, dissolving, or lyophilizing processes. Thus, pharmaceutical preparations for oral use can be obtained by combining the active compounds with solid excipients, optionally grinding the resulting mixture and processing the mixture of granules, after adding suitable auxiliaries, if desired or necessary, to obtain tablets or dragee cores.

Suitable excipients are, in particular, fillers such as saccharides, for example lactose or sucrose, mannitol or sorbitol, cellulose preparations and/or calcium phosphates, for example tricalcium phosphate or calcium hydrogen phosphate, as well

as binders such as starch paste, using, for example, maize starch, wheat starch, rice starch, potato starch, gelatin, tragacanth, methyl cellulose, hydroxypropylmethylcellulose, sodium carboxymethylcellulose, and/or polyvinyl pyrrolidone. If desired, disintegrating agents may be added such as the above-mentioned starches and also carboxymethyl-starch, cross-linked polyvinyl pyrrolidone, agar, or alginic acid or a salt thereof, such as sodium alginate. Auxiliaries are, above all, flow-regulating agents and lubricants, for example, silica, talc, stearic acid or salts thereof, such as magnesium stearate or calcium stearate, and/or polyethylene glycol. Dragee cores are provided with suitable coatings which, if desired, are resistant to gastric juices. For this purpose, concentrated saccharide solutions may be used, which may optionally contain gum arabic, talc, polyvinyl pyrrolidone, polyethylene glycol and/or titanium dioxide, lacquer solutions and suitable organic solvents or solvent mixtures. In order to produce coatings resistant to gastric juices, solutions of suitable cellulose preparations such as acetylcellulose phthalate or hydroxypropymethyl-cellulose phthalate, are used. Dye stuffs or pigments may be added to the tablets or dragee coatings, for example, for identification or in order to characterize combinations of active compound doses.

Other pharmaceutical preparations which can be used orally include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer such as glycerol or sorbitol. The push-fit capsules can contain the active compounds in the form of granules which may be mixed with fillers such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds are preferably dissolved or suspended in suitable liquids, such as fatty oils, or liquid paraffin. In addition, stabilizers may be added.

Possible pharmaceutical preparations, which can be used rectally, include, for example, suppositories, which consist of a combination of one or more of the active compounds with a suppository base. Suitable suppository bases are, for example, natural or synthetic triglycerides, or paraffin hydrocarbons. In addition, it is also possible to use gelatin rectal capsules which consist of a combination of the active

compounds with a base. Possible base materials include, for example, liquid triglycerides, polyethylene glycols, or paraffin hydrocarbons.

Suitable formulations for parenteral administration include aqueous solutions of the active compounds in water-soluble form, for example, water-soluble salts and alkaline solutions. In addition, suspensions of the active compounds as appropriate oily injection suspensions may be administered. Suitable lipophilic solvents or vehicles include fatty oils, for example, sesame oil, or synthetic fatty acid esters, for example, ethyl oleate or triglycerides or polyethylene glycol-400 (the compounds are soluble in PEG-400). Aqueous injection suspensions may contain substances which increase the viscosity of the suspension, and include, for example, sodium carboxymethyl cellulose, sorbitol, and/or dextran. Optionally, the suspension may also contain stabilizers.

The following examples are illustrative, but not limiting, of the method and compositions of the present invention. Other suitable modifications and adaptations of the variety of conditions and parameters normally encountered in clinical therapy and which are obvious to those skilled in the art are within the spirit and scope of the invention.

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☒ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐  
☐

- The additional search fees were accompanied by the applicant's protest.  
No protest accompanied the payment of additional search fees.

## BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

This application contains claims directed to more than one species of the generic invention. These species are deemed to lack Unity of Invention because they are not so linked as to form a single inventive concept under PCT Rule 13.1. The species are as follows:

I. Compounds of formula I where X represents O, S, N or CH<sub>2</sub> and Het represents structures (i), (ii), (iii), (iv) or (v), pharmaceutical compositions containing these compounds and a method of using these compounds.

II. Compounds of formula I where X represents C(O)N or N-C(O) and Het represents structures (i), (ii), (iii), (iv) or (v), pharmaceutical compositions containing these compounds and a method of using these compounds.

III. Compounds of formula I where X represents O, S, N or CH<sub>2</sub> and Het represents structure (vi), pharmaceutical compositions containing these compounds and a method of using these compounds.

IV. Compounds of formula I where X represents C(O)N or N-C(O) and Het represents structure (vi), pharmaceutical compositions containing these compounds and a method of using these compounds.

V. Compounds of formula I where X represents O, S, N or CH<sub>2</sub> and Het represents structures (vii) or (viii), pharmaceutical compositions containing these compounds and a method of using these compounds.

VI. Compounds of formula I where X represents C(O)N or N-C(O) and Het represents structures (vii) or (viii), pharmaceutical compositions containing these compounds and a method of using these compounds.

VII. Compounds of formula I where X represents O, S, N or CH<sub>2</sub> and Het represents structures (ix) or (x), pharmaceutical compositions containing these compounds and a method of using these compounds.

VIII. Compounds of formula I where X represents C(O)N or N-C(O) and Het represents structures (ix) or (x), pharmaceutical compositions containing these compounds and a method of using these compounds.

The claims are deemed to correspond to the species listed above in the following manner:

Species I and II : Claims 4, 11 and 36

Species III : Claim 12

Species V, VI, VII and VIII : Claims 13, 38 and 39

The following claims are generic: Claims 1-3, 5-10, 14-35, 37 and 40-50

The species listed above do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, the species lack the same or corresponding special technical features for the following reasons:
